

A Senior Care Company

October 22, 2008 -- CareOne Incorporates “Wii” Technology In Rehabilitation Programs

CareOne, New Jersey’s largest family owned and operated senior care provider has incorporated “Wii” programming into patient rehabilitation programs at their Centers throughout the state.

Wii programming stations serve as virtual activity stations which allow patients to interface and experience simulated activities, such as: Baseball, bowling, golfing and driving.

According to James Banogon, Director of Therapy Services at CareOne at Dunroven in Cresskill, NJ, “The Wii stations have been a fantastic addition to the tools we utilize to assist our patients in the recovery process. The programs help with balance re-training, motor skills strengthening and improved hand and eye coordination.”

CareOne reports that the programs and technology can be incorporated into treatment plans for a multitude of patient diagnosis, such as: Stroke rehabilitation, Orthopedic rehabilitation and most Cardiac rehabilitation plans to name a few.

“The use of Wii stations in our rehabilitation programs adds another dimension to our care to ensure maximized patient outcomes” says

Rick Speas, CareOne’s Vice President of Rehabilitation Services. “We see enjoyment and therapeutic benefits for all of our patients, regardless of their age or medical condition.

CareOne intends to continue to pursue innovative and creative treatment options in their therapy programs to benefit their patients. Recently, the company also added therapy services 7 days a week at all of their centers. “Healthcare is 24/7.” states Speas, “Rehabilitation should not stop just because it is the weekend.”
